Python developer (4 years in backend). I specialise in designing distributed services, asynchronous architecture and integration platforms. Hands-on experience splitting monoliths, deep refactoring of legacy code and shipping LLM pipelines to production. I work in Python and Go. Active open source contributor with accepted changes in infrastructure and application projects.

Experience

Python Developer, Kartochka (now Omnium)
Dec 2023 — now · 2 yrs 11 mo

- PaaS / infrastructure: Designed and launched an internal PaaS for isolated deployment and operation of customer instances of the platform.
- Architecture: Split the monolith into services and set up CI/CD; the deploy cycle went from several hours to 15 minutes.
- Bitrix24 integration & MCP: Built an integration layer over the Bitrix24 REST API (rate limits, edge cases, sync of CRM, tasks and smart processes). Wrote an MCP server that gives AI agents direct access to portal data.
- AI automation: Built LLM pipelines for document analysis and data extraction, auto-filling CRM entities and embedding AI agents into business processes.
- Open source: Maintain the company fork of the platform and send fixes upstream.

Full Stack Developer, Orbitsoft
Mar — Aug 2023 · 6 mo

- Refactoring and major migration (Django / DRF): Moved a service from Django 3.2 to 4.2 LTS. Untangled the legacy architecture: pulled business logic scattered across views and models into a service layer, resolved breaking changes and updated dependencies.
- Verification service in Go: Designed and wrote a Linux utility service for security validation: checking digital signatures and certificates of Windows executables (.exe) against a trusted database.
- Open source (Plotly Dash): Fixed bugs and extended functionality in the upstream Plotly Dash repository for customer projects.

Python Developer, Escape Tech
Jan 2022 — Mar 2023 · 1 yr 3 mo

- Distributed data collection (Scrapy, Faust, Kafka): Designed collection pipelines for 150+ e-commerce sites with an hourly refresh cycle and stream processing of the queue in Faust/Kafka.

- Anti-bot bypass and rendering (Playwright): Set up stable scraping of complex SPA sites: dynamic proxy pools, session emulation, captcha solving and headless browsers via Playwright.
- Migration to Litestar and optimisation: Rewrote a slow service from legacy Django 2.x / DRF to an async Litestar stack (with Kafka and PostgreSQL). Cut p95 response latency by more than 56% across all scenarios.
